DETAILED DESCRIPTION - The assembly to work thixotropic materials, in a number of steps, has a conveyor system (2a,5) to deliver separate break up dendrites within its crystalline structure. The metal is

metal portions (10) from one station to the following station. At least one station has an electromagnetic stirrer (7) to agitate the metal and molten during at least one stage. An ejector (9) ejects a thixotropic metal body (10) from its vessel (3) or cladding. The vessels (3) are of ceramic or graphite materials. At least one station is a die casting machine (1,2).

USE - The system is for casting components from thixotropic materials, smelted from cooled slabs or bars cut from a continuous die casting process.

ADVANTAGE - The technique gives increased efficiency, lower costs and requires less space.

DESCRIPTION OF DRAWING(S) - The drawing shows a perspective view of the material workstations.
